

OpenID Connect

Swedish Profile WG

Agenda

- Implementer's draft for the attribute specification
- iGov – No more development?
 - Do we need to define an own profile?
- OAuth2 profile
- Certifications
- Verified claims – eKYC & IDA
- Mobile apps and autostart
 - FAPI/CIBA?

Attribute Specification for the Swedish OpenID Connect Profile

- Is now in an “almost ready” state ...
- Is there something missing?
 - Apart from signature claims and definitions of Request Objects
- We should only define claims that actually will be used in OIDC
- Focus on privacy concerns – Try to avoid delivering claims not requested

iGov - International Government Assurance Profile

- Last updated 2018
 - Will there be any more work done?
 - The group still have meetings ...
- The alternative of creating a main spec for OIDC has both pros and cons
- What do we think?

OAuth2

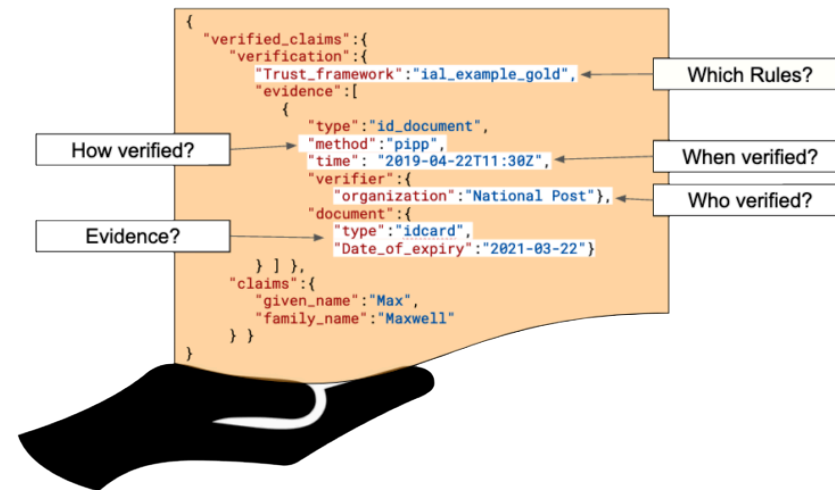

- FYI: DIGG has identified the need for a nation wide approach to authorization
 - I mentioned OAuth2 ...
 - ... and registered oauth2.se

Certifications

- <https://openid.net/certification/>
- Suggestion: We extend the certification for “our profile” ...
- Lessons from the SAML-deployments:
 - Certifications would have been a huge help for smaller actors when acquiring integration services

Verified claims – eKYC & IDA

- Solves a need that some RP:s have ...
- Too bleeding edge?
- Suggestion: As an option

Mobile apps and autostart

- Today: Many apps using BankID has a very smooth flow where the BankID opens automatically and later returns the control to the app.
- Today: Less smooth when using the browser on the mobile device
 - 1177.se (CGI): Poor user experience
 - pensionsmyndigheten.se: Autostart/return works fine (but coding was a nightmare)
- Tomorrow: We can't force the apps into the same complexity as we have for the browsers
- Is CIBA the answer?
 - <https://openid.net/tag/ciba/>
